Background

Rho GTPases play a fundamental role in numerous cellular processes that are initiated by extracellular stimuli that work through G protein coupled receptors. The encoded protein belongs to a family of cytoplasmic proteins that activate the Ras-like family of Rho proteins by exchanging bound GDP

for GTP. It may form a complex with G proteins and stimulate Rho-dependent signals.	This protein is activated by PI3-kinase. Mutat	ions in this gene
can cause X-chromosomal non-specific mental retardation.
