Background

Binds specifically to cytosolic chaperonin (c-CPN) and transfers target proteins to it. Binds to nascent polypeptide chain and promotes folding in an environment in which there are many competing pathways for nonnative proteins. Heterohexamer of two PFD-alpha type and four PFD-beta type subunits. Binds to MYC; interacts with its N-terminal domain. Represses the transcriptional activity of MYC. Highly expressed in pancreas and skeletal muscle and moderately in other tissues. Belongs to the prefoldin subunit alpha family.
